A very detailed, thorough textbook. Not a light read by any means, but quite enjoyable for such complicated material. I'm glad my professor chose this textbook.

Lin Kudla says

Dense. Undergrad-ish, but dense.

Justin says

A lot of interesting info here, but Carlson wrecks it with his horrible way of ordering everything. He goes back and forth in between concepts when it would be so much easier to just go in a straight line with all of the material.

Michelle says

I appreciated the information in this book as I went through a Biological Psychology course in college. The information is straightforward and the pictures help me to understand the processes described in the text. It is easier to read than other neuroscience texts I have read.

The organization of the chapters is a bit confusing, so it is more helpful to jump around rather than read beginning to end.
