### Amy says

I struggled to read this book, especially after the chapter that described a good dozen systems. It was numbing, and I couldn't find a way to apply it to my work, which I find really unfortunate.

### Kelly says

It reads like a textbook, because it probably is. Author is a professor in sustainability. If you are looking for a general read on sustainable design, this is not the book for you--it is exceedingly comprehensive. But if you want exceedingly comprehensive... now you know where to look.

### Ana says

I read this book for a class on sustainability and design thinking. This book contains a lot of important information and it's obvious Shedroff really knows his stuff but is an exceedingly dull read. It basically just reads like one long, rambling lecture of what he thinks designers should do to design for sustainability. It was not at all compelling to me as someone who doesn't identify as a designer and this review is pretty unfair just because I didn't want to read the book in the first place and frankly I'm just mad at my professor for setting it as a required text.
